Can we do better?

In the following we show how to obtain a solution where the number of bins is only

```
OPT(I) + \mathcal{O}(\log^2(SIZE(I))).
```

Note that this is usually better than a guarantee of

 $(1+\epsilon) \operatorname{OPT}(I) + 1$  .

# **Configuration LP**

### **Change of Notation:**

- Group pieces of identical size.
- Let s<sub>1</sub> denote the largest size, and let b<sub>1</sub> denote the number of pieces of size s<sub>1</sub>.
- $s_2$  is second largest size and  $b_2$  number of pieces of size  $s_2$ ;
- ▶ ...
- $s_m$  smallest size and  $b_m$  number of pieces of size  $s_m$ .

## **Configuration LP**

A possible packing of a bin can be described by an *m*-tuple  $(t_1, \ldots, t_m)$ , where  $t_i$  describes the number of pieces of size  $s_i$ . Clearly,

$$\sum_i t_i \cdot s_i \le 1 \; .$$

We call a vector that fulfills the above constraint a configuration.

## **Configuration LP**

Let N be the number of configurations (exponential).

Let  $T_1, \ldots, T_N$  be the sequence of all possible configurations (a configuration  $T_j$  has  $T_{ji}$  pieces of size  $s_i$ ).

$$\begin{array}{c|cccc} \min & & \sum_{j=1}^{N} x_j \\ \text{s.t.} & \forall i \in \{1 \dots m\} & \sum_{j=1}^{N} T_{ji} x_j & \geq & b_i \\ & \forall j \in \{1, \dots, N\} & x_j & \geq & 0 \\ & \forall j \in \{1, \dots, N\} & x_j & \text{integral} \end{array}$$

#### How to solve this LP?

later...

We can assume that each item has size at least 1/SIZE(I).

# **Harmonic Grouping**

- Sort items according to size (monotonically decreasing).
- Process items in this order; close the current group if size of items in the group is at least 2 (or larger). Then open new group.
- ► I.e., G<sub>1</sub> is the smallest cardinality set of largest items s.t. total size sums up to at least 2. Similarly, for G<sub>2</sub>,...,G<sub>r-1</sub>.
- Only the size of items in the last group  $G_r$  may sum up to less than 2.

# **Harmonic Grouping**

From the grouping we obtain instance I' as follows:

- Round all items in a group to the size of the largest group member.
- Delete all items from group  $G_1$  and  $G_r$ .
- For groups  $G_2, \ldots, G_{r-1}$  delete  $n_i n_{i-1}$  items.
- Observe that  $n_i \ge n_{i-1}$ .

#### Lemma 10

The number of different sizes in I' is at most SIZE(I)/2.

- Each group that survives (recall that  $G_1$  and  $G_r$  are deleted) has total size at least 2.
- Hence, the number of surviving groups is at most SIZE(I)/2.
- All items in a group have the same size in *I*'.

#### Lemma 11

The total size of deleted items is at most  $O(\log(SIZE(I)))$ .

- ► The total size of items in G<sub>1</sub> and G<sub>r</sub> is at most 6 as a group has total size at most 3.
- Consider a group  $G_i$  that has strictly more items than  $G_{i-1}$ .
- It discards  $n_i n_{i-1}$  pieces of total size at most

$$3\frac{n_i - n_{i-1}}{n_i} \le \sum_{j=n_{i-1}+1}^{n_i} \frac{3}{j}$$

since the smallest piece has size at most  $3/n_i$ .

Summing over all *i* that have n<sub>i</sub> > n<sub>i-1</sub> gives a bound of at most

$$\sum_{j=1}^{n_{r-1}} \frac{3}{j} \leq \mathcal{O}(\log(\text{SIZE}(I))) \ .$$

(note that  $n_r \leq \text{SIZE}(I)$  since we assume that the size of each item is at least 1/SIZE(I)).

### Algorithm 1 BinPack

- 1: **if** SIZE(I) < 10 **then**
- 2: pack remaining items greedily
- 3: Apply harmonic grouping to create instance I'; pack discarded items in at most  $O(\log(\text{SIZE}(I)))$  bins.
- 4: Let x be optimal solution to configuration LP
- 5: Pack  $\lfloor x_j \rfloor$  bins in configuration  $T_j$  for all j; call the packed instance  $I_1$ .
- 6: Let  $I_2$  be remaining pieces from I'
- 7: Pack  $I_2$  via BinPack $(I_2)$

# Analysis

### $OPT_{LP}(I_1) + OPT_{LP}(I_2) \le OPT_{LP}(I') \le OPT_{LP}(I)$

Proof:

- ► Each piece surviving in I' can be mapped to a piece in I of no lesser size. Hence, OPT<sub>LP</sub>(I') ≤ OPT<sub>LP</sub>(I)
- $\lfloor x_j \rfloor$  is feasible solution for  $I_1$  (even integral).
- $x_j \lfloor x_j \rfloor$  is feasible solution for  $I_2$ .

# Analysis

Each level of the recursion partitions pieces into three types

- 1. Pieces discarded at this level.
- **2.** Pieces scheduled because they are in  $I_1$ .
- **3.** Pieces in  $I_2$  are handed down to the next level.

Pieces of type 2 summed over all recursion levels are packed into at most  $\mathrm{OPT}_{\mathrm{LP}}$  many bins.

Pieces of type 1 are packed into at most

 $\mathcal{O}(\log(\text{SIZE}(I))) \cdot L$ 

many bins where L is the number of recursion levels.

# Analysis

We can show that  $SIZE(I_2) \le SIZE(I)/2$ . Hence, the number of recursion levels is only  $O(\log(SIZE(I_{original})))$  in total.

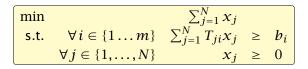

- ► The number of non-zero entries in the solution to the configuration LP for I' is at most the number of constraints, which is the number of different sizes (≤ SIZE(I)/2).
- ► The total size of items in I<sub>2</sub> can be at most ∑<sub>j=1</sub><sup>N</sup> x<sub>j</sub> ⌊x<sub>j</sub>⌋ which is at most the number of non-zero entries in the solution to the configuration LP.

## How to solve the LP?

Let  $T_1, \ldots, T_N$  be the sequence of all possible configurations (a configuration  $T_j$  has  $T_{ji}$  pieces of size  $s_i$ ). In total we have  $b_i$  pieces of size  $s_i$ .

#### Primal

Dual

$$\begin{array}{ll} \max & \sum_{i=1}^{m} y_i b_i \\ \text{s.t.} & \forall j \in \{1, \dots, N\} \quad \sum_{i=1}^{m} T_{ji} y_i \leq 1 \\ & \forall i \in \{1, \dots, m\} \quad y_i \geq 0 \end{array}$$

## **Separation Oracle**

Suppose that I am given variable assignment y for the dual.

### How do I find a violated constraint?

I have to find a configuration  $T_j = (T_{j1}, \ldots, T_{jm})$  that

is feasible, i.e.,

$$\sum_{i=1}^m T_{ji} \cdot s_i \leq 1$$
 ,

and has a large profit

$$\sum_{i=1}^{m} T_{ji} y_i > 1$$

#### But this is the Knapsack problem.

### **Separation Oracle**

We have FPTAS for Knapsack. This means if a constraint is violated with  $1 + \epsilon' = 1 + \frac{\epsilon}{1-\epsilon}$  we find it, since we can obtain at least  $(1 - \epsilon)$  of the optimal profit.

The solution we get is feasible for:

Dual'

$$\begin{array}{|c|c|c|c|c|c|} \hline \max & & \sum_{i=1}^{m} y_i b_i \\ \text{s.t.} & \forall j \in \{1, \dots, N\} & \sum_{i=1}^{m} T_{ji} y_i & \leq & 1 + \epsilon' \\ & \forall i \in \{1, \dots, m\} & y_i & \geq & 0 \end{array}$$

Primal'

## **Separation Oracle**

If the value of the computed dual solution (which may be infeasible) is z then

 $OPT \le z \le (1 + \epsilon')OPT$ 

#### How do we get good primal solution (not just the value)?

- The constraints used when computing z certify that the solution is feasible for DUAL'.
- Suppose that we drop all unused constraints in DUAL. We will compute the same solution feasible for DUAL'.
- ► Let DUAL'' be DUAL without unused constraints.
- The dual to DUAL" is PRIMAL where we ignore variables for which the corresponding dual constraint has not been used.
- The optimum value for PRIMAL'' is at most  $(1 + \epsilon')$ OPT.
- We can compute the corresponding solution in polytime.

This gives that overall we need at most

```
(1 + \epsilon') \text{OPT}_{\text{LP}}(I) + \mathcal{O}(\log^2(\text{SIZE}(I)))
```

bins.

We can choose  $\epsilon' = \frac{1}{OPT}$  as  $OPT \leq \#$ items and since we have a fully polynomial time approximation scheme (FPTAS) for knapsack.
