#### How do you measure?

### Implementing and testing on representative inputs

- How do you choose your inputs?
- May be very time-consuming.
- Very reliable results if done correctly.
- Results only hold for a specific machine and for a specific set of inputs.
- Theoretical analysis in a specific model of computation.
  - Gives concerning the second like "this algorithm always runs in time of us of "
  - Typically focuses on the
  - Can give lower bounds like "any comparison-based sorting algorithm needs at least (200 key to) comparisons in the
    - worst case".

### Input length

The theoretical bounds are usually given by a function  $f : \mathbb{N} \to \mathbb{N}$  that maps the input length to the running time (or storage space, comparisons, multiplications, program size etc.).

### The input length may e.g. be

- the size of the input (number of bits)
- the number of arguments

#### Excample

Suppose of numbers from the interval (1999, 50) have to be sorted. In this case we usually say that the input length is or instead of e.g. (2009, 5), which would be the number of bits required to encode the input.

4 Modelling Issues

- the number of arguments

### Example 1

Suppose *n* numbers from the interval  $\{1, ..., N\}$  have to be sorted. In this case we usually say that the input length is *n* instead of e.g.  $n \log N$ , which would be the number of bits required to encode the input.

4 Modelling Issues

## **Model of Computation**

### How to measure performance

- calculate running unle and stolkage space etc. on a simplified, idealized model of computation, e.g. Random Access Machine (RAM), Turing Machine (TM), ....
- Calculate number of certain basic operations: comparisons, multiplications, harddisc accesses, ....

Version 3: is often easier, but focusing on one type of operation makes it more difficult to obtain meaningful results.

#### Very simple model of computation.

- Only the "current" memory location can be altered.
- Very good model for discussing computabiliy, or polynomial vs. exponential time.
- Some simple problems like recognizing whether input is of the form xx, where x is a string, have quadratic lower bound.
- $\Rightarrow$  Not a good model for developing efficient algorithms.

best-case complexity:

 $C_{\rm bc}(n) := \min\{C(x) \mid |x| = n\}$ 

Usually easy to analyze, but not very meaningful.

worst-case complexity:

 $C_{\rm WC}(n) := \max\{C(x) \mid |x| = n\}$ 

Usually moderately easy to analyze; sometimes too pessimistic.

average case complexity:

$$C_{\text{avg}}(n) := \frac{1}{|I_n|} \sum_{|x|=n} C(x)$$

more general: probability measure  $\mu$ 

$$C_{\text{avg}}(n) := \sum_{x \in I_n} \mu(x) \cdot C(x)$$

randomized complexity:

The algorithm may use random bits. Expected running time (over all possible choices of random bits) for a fixed input

*x*. Then take the worst-case over all *x* with |x| = n.

We are usually not interested in exact running times, but only in an asymptotic classification of the running time, that ignores constant factors and constant additive offsets.

values of 6... Then constant additive terms do not play an important role.

- An exact analysis (e.g. exactly counting the number of operations in a RAM) may be hard, but wouldn't lead to more precise results as the computational model is already quite a distance from reality.
- A linear speed-up (i.e., by a constant factor) is always possible by e.g. implementing the algorithm on a faster machine.

Running time should be expressed by simple functions.

- We are usually interested in the running times for large values of n. Then constant additive terms do not play an important role.

In general asymptotic classification of running times is a good measure for comparing algorithms:

- If the running time analysis is tight and actually occurs in practise (i.e., the asymptotic bound is not a purely theoretical worst-case bound), then the algorithm that has better asymptotic running time will always outperform a weaker algorithm for large enough values of n.
- However, suppose that I have two algorithms:
   Algorithm & Running time
   Algorithm & Running time
   Clearly
   Algorithm & Running time
   Algorithm & Running time

In general asymptotic classification of running times is a good measure for comparing algorithms:

- If the running time analysis is tight and actually occurs in practise (i.e., the asymptotic bound is not a purely theoretical worst-case bound), then the algorithm that has better asymptotic running time will always outperform a weaker algorithm for large enough values of n.
- However, suppose that I have two algorithms:
  - ▶ Algorithm A. Running time f(n) = 1000 log n = O(log n).
     ▶ Algorithm B. Running time g(n) = log<sup>2</sup> n.

In general asymptotic classification of running times is a good measure for comparing algorithms:

Algorithm 2 mergesort(list L)1:  $n \leftarrow size(L)$ 2: if  $n \leq 1$  return L3:  $L_1 \leftarrow L[1 \cdots \lfloor \frac{n}{2}]]$ 4:  $L_2 \leftarrow L[\lfloor \frac{n}{2} \rfloor + 1 \cdots n]$ 5: mergesort(L\_1)6: mergesort(L\_2)7:  $L \leftarrow merge(L_1, L_2)$ 8: return L

This algorithm requires

 $T(n) = T\left(\left\lceil \frac{n}{2} \right\rceil\right) + T\left(\left\lfloor \frac{n}{2} \right\rfloor\right) + \mathcal{O}(n) \le 2T\left(\left\lceil \frac{n}{2} \right\rceil\right) + \mathcal{O}(n)$ 

comparisons when n > 1 and 0 comparisons when  $n \le 1$ .

Ernst Mayr, Harald Räcke

### Recurrences

# How do we bring the expression for the number of comparisons ( $\approx$ running time) into a closed form?

For this we need to solve the recurrence.

**6** Recurrences

# How do we bring the expression for the number of comparisons ( $\approx$ running time) into a closed form?

For this we need to solve the recurrence.

**6** Recurrences

# **Methods for Solving Recurrences**

### 1. Guessing+Induction

Guess the right solution and prove that it is correct via induction. It needs experience to make the right guess.

### 2. Master Theorem

For a lot of recurrences that appear in the analysis of algorithms this theorem can be used to obtain tight asymptotic bounds. It does not provide exact solutions.

### 3. Characteristic Polynomial

Linear homogenous recurrences can be solved via this method.

# **Methods for Solving Recurrences**

### 4. Generating Functions

A more general technique that allows to solve certain types of linear inhomogenous relations and also sometimes non-linear recurrence relations.

### 5. Transformation of the Recurrence

Sometimes one can transform the given recurrence relations so that it e.g. becomes linear and can therefore be solved with one of the other techniques.

6 Recurrences

First we need to get rid of the  $\mathcal{O}$ -notation in our recurrence:

$$T(n) \leq \begin{cases} 2T(\left\lceil \frac{n}{2} \right\rceil) + cn & n \ge 2\\ 0 & \text{otherwise} \end{cases}$$

6.1 Guessing+Induction

◆ 個 ▶ ◆ 臣 ▶ ◆ 臣 ▶ 47/432

First we need to get rid of the  $\mathcal{O}$ -notation in our recurrence:

$$T(n) \leq \begin{cases} 2T(\left\lceil \frac{n}{2} \right\rceil) + cn & n \ge 2\\ 0 & \text{otherwise} \end{cases}$$

Assume that instead we had

$$T(n) \leq \begin{cases} 2T(\frac{n}{2}) + cn & n \ge 2\\ 0 & \text{otherwise} \end{cases}$$

6.1 Guessing+Induction

First we need to get rid of the  $\mathcal{O}$ -notation in our recurrence:

$$T(n) \leq \begin{cases} 2T(\left\lceil \frac{n}{2} \right\rceil) + cn & n \ge 2\\ 0 & \text{otherwise} \end{cases}$$

Assume that instead we had

$$T(n) \leq \begin{cases} 2T(\frac{n}{2}) + cn & n \ge 2\\ 0 & \text{otherwise} \end{cases}$$

One way of solving such a recurrence is to guess a solution, and check that it is correct by plugging it in.

Suppose we guess  $T(n) \le dn \log n$  for a constant *d*.

$$= dn\log n + (c - d)n$$
$$\le dn\log n$$

$$T(n) \leq \begin{cases} 2T(\frac{n}{2}) + cn & n \ge 16\\ b & \text{otw.} \end{cases}$$

**Guess:**  $T(n) \le dn \log n$ . **Proof.** (by induction)

- **base case**  $(2 \le n < 16)$ : true if we choose  $d \ge b$ .
- induction step  $2 \dots n 1 \rightarrow n$ :

Suppose statem. is true for  $n' \in \{2, ..., n-1\}$ , and  $n \ge 16$ . We prove it for n:

$$T(n) \le 2T\left(\frac{n}{2}\right) + cn$$
$$\le 2\left(d\frac{n}{2}\log\frac{n}{2}\right) + cn$$
$$= dn(\log n - 1) + cn$$
$$= dn\log n + (c - d)n$$
$$\le dn\log n$$

Hence, statement is true if we choose  $d \ge c$ .

Why did we change the recurrence by getting rid of the ceiling?

6.1 Guessing+Induction

**◆ @ ▶ ◆** 聖 ▶ ◆ 聖 ▶ 50/432

Why did we change the recurrence by getting rid of the ceiling?

If we do not do this we instead consider the following recurrence:

$$T(n) \le \begin{cases} 2T(\left\lceil \frac{n}{2} \right\rceil) + cn & n \ge 16\\ b & \text{otherwise} \end{cases}$$

Why did we change the recurrence by getting rid of the ceiling?

If we do not do this we instead consider the following recurrence:

$$T(n) \le \begin{cases} 2T(\left\lceil \frac{n}{2} \right\rceil) + cn & n \ge 16\\ b & \text{otherwise} \end{cases}$$

Note that we can do this as for constant-sized inputs the running time is always some constant (*b* in the above case).

We also make a guess of  $T(n) \leq dn \log n$  and get

T(n)

$$\leq dn\log n$$

for a suitable choice of d.

### 6.2 Master Theorem

#### Lemma 4

Let  $a \ge 1, b \ge 1$  and  $\epsilon > 0$  denote constants. Consider the recurrence

$$T(n) = aT\left(\frac{n}{b}\right) + f(n) \; .$$

Case 1. If  $f(n) = O(n^{\log_b(a) - \epsilon})$  then  $T(n) = O(n^{\log_b a})$ .

Case 2. If  $f(n) = \Theta(n^{\log_b(a)} \log^k n)$  then  $T(n) = \Theta(n^{\log_b a} \log^{k+1} n)$ ,  $k \ge 0$ .

*Case 3.* If  $f(n) = \Omega(n^{\log_b(a)+\epsilon})$  and for sufficiently large n $af(\frac{n}{b}) \le cf(n)$  for some constant c < 1 then  $T(n) = \Theta(f(n))$ . We prove the Master Theorem for the case that n is of the form  $b^{\ell}$ , and we assume that the non-recursive case occurs for problem size 1 and incurs cost 1.

## 6.2 Master Theorem

This gives

$$T(n) = n^{\log_b a} + \sum_{i=0}^{\log_b n-1} a^i f\left(\frac{n}{b^i}\right) \ .$$

7: $Z_0 \leftarrow \operatorname{mult}(A_0, B_0)$	$T(\frac{n}{2})$
8: <b>return</b> $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$	$\mathcal{O}(n)$

Algorithm 3 mult(A, B)	
1: if $ A  =  B  = 1$ then	$\mathcal{O}(1)$
2: <b>return</b> $a_0 \cdot b_0$	$\mathcal{O}(1)$
3: split A into $A_0$ and $A_1$	$\mathcal{O}(n)$
4: split <i>B</i> into $B_0$ and $B_1$	$\mathcal{O}(n)$
5: $Z_2 \leftarrow \operatorname{mult}(A_1, B_1)$	$T(\frac{n}{2})$
6: $Z_1 \leftarrow \operatorname{mult}(A_1, B_0) + \operatorname{mult}(A_0, B_1)$	$2T(\frac{n}{2}) + \mathcal{O}(n)$
7: $Z_0 \leftarrow \operatorname{mult}(A_0, B_0)$	$T(\frac{n}{2})$
8: return $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$	$\mathcal{O}(n)$

We get the following recurrence:

$$T(n) = 4T\left(\frac{n}{2}\right) + \mathcal{O}(n)$$
.

**Master Theorem:** Recurrence:  $T[n] = aT(\frac{n}{b}) + f(n)$ .

- Case 1:  $f(n) = O(n^{\log_b a \epsilon})$   $T(n) = O(n^{\log_b a})$
- ► Case 2:  $f(n) = \Theta(n^{\log_b a} \log^k n)$   $T(n) = \Theta(n^{\log_b a} \log^{k+1} n)$
- Case 3:  $f(n) = \Omega(n^{\log_b a + \epsilon})$   $T(n) = \Theta(f(n))$

**Master Theorem:** Recurrence:  $T[n] = aT(\frac{n}{b}) + f(n)$ .

- Case 1:  $f(n) = O(n^{\log_b a \epsilon})$   $T(n) = O(n^{\log_b a})$
- ► Case 2:  $f(n) = \Theta(n^{\log_b a} \log^k n)$   $T(n) = \Theta(n^{\log_b a} \log^{k+1} n)$
- Case 3:  $f(n) = \Omega(n^{\log_b a + \epsilon})$   $T(n) = \Theta(f(n))$

In our case a = 4, b = 2, and  $f(n) = \Theta(n)$ . Hence, we are in Case 1, since  $n = O(n^{2-\epsilon}) = O(n^{\log_b a - \epsilon})$ .

**Master Theorem:** Recurrence:  $T[n] = aT(\frac{n}{b}) + f(n)$ .

- Case 1:  $f(n) = O(n^{\log_b a \epsilon})$   $T(n) = O(n^{\log_b a})$
- ► Case 2:  $f(n) = \Theta(n^{\log_b a} \log^k n)$   $T(n) = \Theta(n^{\log_b a} \log^{k+1} n)$
- Case 3:  $f(n) = \Omega(n^{\log_b a + \epsilon})$   $T(n) = \Theta(f(n))$

In our case a = 4, b = 2, and  $f(n) = \Theta(n)$ . Hence, we are in Case 1, since  $n = O(n^{2-\epsilon}) = O(n^{\log_b a - \epsilon})$ .

We get a running time of  $\mathcal{O}(n^2)$  for our algorithm.

**Master Theorem:** Recurrence:  $T[n] = aT(\frac{n}{b}) + f(n)$ .

- Case 1:  $f(n) = O(n^{\log_b a \epsilon})$   $T(n) = O(n^{\log_b a})$
- Case 2:  $f(n) = \Theta(n^{\log_b a} \log^k n)$   $T(n) = \Theta(n^{\log_b a} \log^{k+1} n)$
- Case 3:  $f(n) = \Omega(n^{\log_b a + \epsilon})$   $T(n) = \Theta(f(n))$

In our case a = 4, b = 2, and  $f(n) = \Theta(n)$ . Hence, we are in Case 1, since  $n = O(n^{2-\epsilon}) = O(n^{\log_b a - \epsilon})$ .

We get a running time of  $\mathcal{O}(n^2)$  for our algorithm.

 $\Rightarrow$  Not better then the "school method".

We can use the following identity to compute  $Z_1$ :

6.2 Master Theorem

◆ ● ◆ ● ◆ ● ◆
 66/432

We can use the following identity to compute  $Z_1$ :

 $Z_1 = A_1 B_0 + A_0 B_1$ 

We can use the following identity to compute  $Z_1$ :

 $Z_1 = A_1 B_0 + A_0 B_1$ =  $(A_0 + A_1) \cdot (B_0 + B_1) - A_1 B_1 - A_0 B_0$ 

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1 = Z_2 = Z_0$$
  
= (A\_0 + A\_1) \cdot (B\_0 + B\_1) - A\_1 B\_1 - A\_0 B\_0

6.2 Master Theorem

◆ 個 ▶ ◆ 聖 ▶ ◆ 聖 ▶ 66/432

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1 = Z_2 = Z_0$$
  
= (A\_0 + A\_1) \cdot (B\_0 + B\_1) - A\_1 B\_1 - A\_0 B\_0

Hence,

6.2 Master Theorem

◆ 個 ▶ ◆ 聖 ▶ ◆ 聖 ▶ 66/432

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1 = Z_2 = Z_0$$
  
= (A\_0 + A\_1) \cdots (B\_0 + B\_1) - A\_1 B\_1 - A\_0 B\_0

Hence,

Algorithm 4 mult(A, B)
1: if $ A  =  B  = 1$ then
2: <b>return</b> $a_0 \cdot b_0$
3: split $A$ into $A_0$ and $A_1$
4: split <i>B</i> into $B_0$ and $B_1$
5: $Z_2 \leftarrow \operatorname{mult}(A_1, B_1)$
6: $Z_0 \leftarrow \operatorname{mult}(A_0, B_0)$
7: $Z_1 \leftarrow \text{mult}(A_0 + A_1, B_0 + B_1) - Z_2 - Z_0$
8: return $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1 = Z_2 = Z_0$$
  
= (A\_0 + A\_1) \cdots (B\_0 + B\_1) - A\_1 B\_1 - A\_0 B\_0

Hence,

 Algorithm 4 mult(A, B)
 0 

 1: if |A| = |B| = 1 then
 0 

 2: return  $a_0 \cdot b_0$  0 

 3: split A into  $A_0$  and  $A_1$  0 

 4: split B into  $B_0$  and  $B_1$  0 

 5:  $Z_2 \leftarrow mult(A_1, B_1)$  0 

 6:  $Z_0 \leftarrow mult(A_0, B_0)$  0 

 7:  $Z_1 \leftarrow mult(A_0 + A_1, B_0 + B_1) - Z_2 - Z_0$  0 

 8: return  $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$ 

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1 = Z_2 = Z_0$$
  
= (A\_0 + A\_1) \cdots (B\_0 + B\_1) - A\_1 B\_1 - A\_0 B\_0

Hence,

 Algorithm 4 mult(A, B)
 0 

 1: if |A| = |B| = 1 then
 0 

 2: return  $a_0 \cdot b_0$  0 

 3: split A into  $A_0$  and  $A_1$  0 

 4: split B into  $B_0$  and  $B_1$  0 

 5:  $Z_2 \leftarrow mult(A_1, B_1)$  0 

 6:  $Z_0 \leftarrow mult(A_0, B_0)$   $Z_1 \leftarrow mult(A_0 + A_1, B_0 + B_1) - Z_2 - Z_0$  

 8: return  $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$ 

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1 = Z_2 = Z_0$$
  
= (A\_0 + A\_1) \cdots (B\_0 + B\_1) - A\_1 B\_1 - A\_0 B\_0

Hence,

 Algorithm 4 mult(A, B)
 0(1)

 1: if |A| = |B| = 1 then
 0(1)

 2: return  $a_0 \cdot b_0$  0(1)

 3: split A into  $A_0$  and  $A_1$  0(n)

 4: split B into  $B_0$  and  $B_1$  0(n)

 5:  $Z_2 \leftarrow mult(A_1, B_1)$  0:

 6:  $Z_0 \leftarrow mult(A_0, B_0)$  7:  $Z_1 \leftarrow mult(A_0 + A_1, B_0 + B_1) - Z_2 - Z_0$  

 8: return  $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$ 

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1 = Z_2 = Z_0$$
  
= (A\_0 + A\_1) \cdots (B\_0 + B\_1) - A\_1 B\_1 - A\_0 B\_0

Hence,

 Algorithm 4 mult(A, B)
 0(1)

 1: if |A| = |B| = 1 then
 0(1)

 2: return  $a_0 \cdot b_0$  0(1)

 3: split A into  $A_0$  and  $A_1$  0(n)

 4: split B into  $B_0$  and  $B_1$  0(n)

 5:  $Z_2 \leftarrow mult(A_1, B_1)$  0(n)

 6:  $Z_0 \leftarrow mult(A_0, B_0)$  7:  $Z_1 \leftarrow mult(A_0 + A_1, B_0 + B_1) - Z_2 - Z_0$  

 8: return  $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$ 

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1 = Z_2 = Z_0$$
  
= (A\_0 + A\_1) \cdots (B\_0 + B\_1) - A\_1 B\_1 - A\_0 B\_0

Hence,

Algorithm 4 mult(A, B)	
1: if $ A  =  B  = 1$ then	$\mathcal{O}(1)$
2: <b>return</b> $a_0 \cdot b_0$	$\mathcal{O}(1)$
3: split $A$ into $A_0$ and $A_1$	$\mathcal{O}(n)$
4: split <i>B</i> into $B_0$ and $B_1$	$\mathcal{O}(n)$
5: $Z_2 \leftarrow \operatorname{mult}(A_1, B_1)$	$T(\frac{n}{2})$
6: $Z_0 \leftarrow \operatorname{mult}(A_0, B_0)$	
7: $Z_1 \leftarrow \text{mult}(A_0 + A_1, B_0 + B_1) - Z_2 - Z_0$	
8: <b>return</b> $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$	

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1 = Z_2 = Z_0$$
  
= (A\_0 + A\_1) \cdots (B\_0 + B\_1) - A\_1 B\_1 - A\_0 B\_0

Hence,

Algorithm 4 mult(A, B)	
1: if $ A  =  B  = 1$ then	$\mathcal{O}(1)$
2: <b>return</b> $a_0 \cdot b_0$	$\mathcal{O}(1)$
3: split $A$ into $A_0$ and $A_1$	$\mathcal{O}(n)$
4: split <i>B</i> into $B_0$ and $B_1$	$\mathcal{O}(n)$
5: $Z_2 \leftarrow \operatorname{mult}(A_1, B_1)$	$T(\frac{n}{2})$
6: $Z_0 \leftarrow \operatorname{mult}(A_0, B_0)$	$T(\frac{n}{2})$
7: $Z_1 \leftarrow \text{mult}(A_0 + A_1, B_0 + B_1) - Z_2 - Z_0$	
8: <b>return</b> $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$	

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1 = Z_2 = Z_0$$
  
= (A\_0 + A\_1) \cdots (B\_0 + B\_1) - A\_1 B\_1 - A\_0 B\_0

Hence,

Algorithm 4 mult(A, B)	
1: if $ A  =  B  = 1$ then	$\mathcal{O}(1)$
2: <b>return</b> $a_0 \cdot b_0$	$\mathcal{O}(1)$
3: split $A$ into $A_0$ and $A_1$	$\mathcal{O}(n)$
4: split <i>B</i> into $B_0$ and $B_1$	$\mathcal{O}(n)$
5: $Z_2 \leftarrow \operatorname{mult}(A_1, B_1)$	$T(\frac{n}{2})$
6: $Z_0 \leftarrow \operatorname{mult}(A_0, B_0)$	$T(\frac{n}{2})$
7: $Z_1 \leftarrow \text{mult}(A_0 + A_1, B_0 + B_1) - Z_2 - Z_0$	$T(\frac{n}{2}) + \mathcal{O}(n)$
8: <b>return</b> $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$	

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1 = Z_2 = Z_0$$
  
= (A\_0 + A\_1) \cdots (B\_0 + B\_1) - A\_1 B\_1 - A\_0 B\_0

Hence,

Algorithm 4 mult(A, B)	
1: if $ A  =  B  = 1$ then	$\mathcal{O}(1)$
2: <b>return</b> $a_0 \cdot b_0$	$\mathcal{O}(1)$
3: split $A$ into $A_0$ and $A_1$	$\mathcal{O}(n)$
4: split <i>B</i> into $B_0$ and $B_1$	$\mathcal{O}(n)$
5: $Z_2 \leftarrow \operatorname{mult}(A_1, B_1)$	$T(\frac{n}{2})$
6: $Z_0 \leftarrow \operatorname{mult}(A_0, B_0)$	$T(\frac{n}{2})$
7: $Z_1 \leftarrow \text{mult}(A_0 + A_1, B_0 + B_1) - Z_2 - Z_0$	$T(\frac{n}{2}) + \mathcal{O}(n)$
8: <b>return</b> $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$	$\mathcal{O}(n)$

We get the following recurrence:

$$T(n) = 3T\left(\frac{n}{2}\right) + \mathcal{O}(n) \ .$$

Master Theorem: Recurrence:  $T[n] = aT(\frac{n}{b}) + f(n)$ .

- Case 1:  $f(n) = O(n^{\log_b a \epsilon})$   $T(n) = O(n^{\log_b a})$
- Case 2:  $f(n) = \Theta(n^{\log_b a} \log^k n)$   $T(n) = \Theta(n^{\log_b a} \log^{k+1} n)$
- Case 3:  $f(n) = \Omega(n^{\log_b a + \epsilon})$   $T(n) = \Theta(f(n))$

Again we are in Case 1. We get a running time of  $\Theta(n^{\log_2 3}) \approx \Theta(n^{1.59}).$ 

A huge improvement over the "school method".

We get the following recurrence:

$$T(n) = 3T\left(\frac{n}{2}\right) + \mathcal{O}(n) \ .$$

**Master Theorem:** Recurrence:  $T[n] = aT(\frac{n}{h}) + f(n)$ .

- Case 1:  $f(n) = O(n^{\log_b a \epsilon})$   $T(n) = \Theta(n^{\log_b a})$
- Case 2:  $f(n) = \Theta(n^{\log_b a} \log^k n)$   $T(n) = \Theta(n^{\log_b a} \log^{k+1} n)$
- Case 3:  $f(n) = \Omega(n^{\log_b a + \epsilon})$   $T(n) = \Theta(f(n))$

Again we are in Case 1. We get a running time of  $\Theta(n^{\log_2 3}) pprox \Theta(n^{1.59}).$ 

A huge improvement over the "school method".

We get the following recurrence:

$$T(n) = 3T\left(\frac{n}{2}\right) + \mathcal{O}(n) \ .$$

Consider the recurrence relation:

 $c_0T(n) + c_1T(n-1) + c_2T(n-2) + \cdots + c_kT(n-k) = f(n)$ 

This is the general form of a linear recurrence relation of order k with constant coefficients ( $c_0, c_k \neq 0$ ).

- Control only depends on the 3 preceding values. This means the recurrence relation is of second s.
  - The recurrence is linear as there are no products of  $\partial [m]/s$  .
  - then the recurrence relation becomes a linear, recurrence relation of order 3.

Consider the recurrence relation:

 $c_0T(n) + c_1T(n-1) + c_2T(n-2) + \cdots + c_kT(n-k) = f(n)$ 

This is the general form of a linear recurrence relation of order k with constant coefficients ( $c_0, c_k \neq 0$ ).

- T(n) only depends on the k preceding values. This means the recurrence relation is of order k.
- ▶ The recurrence is linear as there are no products of *T*[*n*]'s.
- If f(n) = 0 then the recurrence relation becomes a linear, homogenous recurrence relation of order k.

Consider the recurrence relation:

 $c_0T(n) + c_1T(n-1) + c_2T(n-2) + \cdots + c_kT(n-k) = f(n)$ 

This is the general form of a linear recurrence relation of order k with constant coefficients ( $c_0, c_k \neq 0$ ).

- T(n) only depends on the k preceding values. This means the recurrence relation is of order k.
- The recurrence is linear as there are no products of T[n]'s.
- If f(n) = 0 then the recurrence relation becomes a linear, homogenous recurrence relation of order k.

Consider the recurrence relation:

 $c_0T(n) + c_1T(n-1) + c_2T(n-2) + \dots + c_kT(n-k) = f(n)$ 

This is the general form of a linear recurrence relation of order k with constant coefficients ( $c_0, c_k \neq 0$ ).

- T(n) only depends on the k preceding values. This means the recurrence relation is of order k.
- ► The recurrence is linear as there are no products of *T*[*n*]'s.
- If f(n) = 0 then the recurrence relation becomes a linear, homogenous recurrence relation of order k.

Consider the recurrence relation:

 $c_0T(n) + c_1T(n-1) + c_2T(n-2) + \cdots + c_kT(n-k) = f(n)$ 

This is the general form of a linear recurrence relation of order k with constant coefficients ( $c_0, c_k \neq 0$ ).

- T(n) only depends on the k preceding values. This means the recurrence relation is of order k.
- ► The recurrence is linear as there are no products of *T*[*n*]'s.
- ► If f(n) = 0 then the recurrence relation becomes a linear, homogenous recurrence relation of order k.

Consider the recurrence relation:

 $c_0T(n) + c_1T(n-1) + c_2T(n-2) + \cdots + c_kT(n-k) = f(n)$ 

This is the general form of a linear recurrence relation of order k with constant coefficients ( $c_0, c_k \neq 0$ ).

- ► If f(n) = 0 then the recurrence relation becomes a linear, homogenous recurrence relation of order k.

### **Observations:**

- ► The solution T[1], T[2], T[3],... is completely determined by a set of boundary conditions that specify values for T[1],..., T[k].
- In fact, any k consecutive values completely determine the solution.
- k non-concecutive values might not be an appropriate set of boundary conditions (depends on the problem).

Approach:

- First determine all solutions that satisfy recurrence relation.
- Then pick the right one by analyzing boundary conditions.
- First consider the homogenous case.

#### **Observations:**

## **The Homogenous Case**

#### The solution space

 $S = \left\{ \mathcal{T} = T[1], T[2], T[3], \dots \mid \mathcal{T} \text{ fulfills recurrence relation} \right\}$ 

is a vector space. This means that if  $T_1, T_2 \in S$ , then also  $\alpha T_1 + \beta T_2 \in S$ , for arbitrary constants  $\alpha, \beta$ .

How do we find a non-trivial solution?

We guess that the solution is of the form  $\lambda^n$ ,  $\lambda \neq 0$ , and see what happens. In order for this guess to fulfill the recurrence we need

$$c_0\lambda^n + c_1\lambda^{n-1} + c_2 \cdot \lambda^{n-2} + \dots + c_k \cdot \lambda^{n-k} = 0$$

for all  $n \ge k$ .

The solution space

 $S = \left\{ \mathcal{T} = T[1], T[2], T[3], \dots \mid \mathcal{T} \text{ fulfills recurrence relation} \right\}$ 

is a vector space. This means that if  $\mathcal{T}_1, \mathcal{T}_2 \in S$ , then also  $\alpha \mathcal{T}_1 + \beta \mathcal{T}_2 \in S$ , for arbitrary constants  $\alpha, \beta$ .

#### How do we find a non-trivial solution?

#### How do we find a non-trivial solution?

We guess that the solution is of the form  $\lambda^n$ ,  $\lambda \neq 0$ , and see what happens. In order for this guess to fulfill the recurrence we need

$$c_0\lambda^n + c_1\lambda^{n-1} + c_2 \cdot \lambda^{n-2} + \dots + c_k \cdot \lambda^{n-k} = 0$$

for all  $n \ge k$ .

Ernst Mavr. Harald Räcke

Dividing by  $\lambda^{n-k}$  gives that all these constraints are identical to

$$c_0\lambda^k + c_1\lambda^{k-1} + c_2\cdot\lambda^{k-2} + \cdots + c_k = 0$$

This means that if  $\lambda_i$  is a root (Nullstelle) of  $P[\lambda]$  then  $T[n] = \lambda_i^n$  is a solution to the recurrence relation.

Let  $\lambda_1, \ldots, \lambda_k$  be the k (complex) roots of  $P[\lambda]$ . Then, because of the vector space property

$$\alpha_1\lambda_1^n + \alpha_2\lambda_2^n + \cdots + \alpha_k\lambda_k^n$$

Dividing by  $\lambda^{n-k}$  gives that all these constraints are identical to

$$\underbrace{c_0 \lambda^k + c_1 \lambda^{k-1} + c_2 \cdot \lambda^{k-2} + \dots + c_k}_{\text{characteristic polynomial } P[\lambda]} = 0$$

This means that if  $\lambda_i$  is a root (Nullstelle) of  $P[\lambda]$  then  $T[n] = \lambda_i^n$  is a solution to the recurrence relation.

Let  $\lambda_1, \ldots, \lambda_k$  be the k (complex) roots of  $P[\lambda]$ . Then, because of the vector space property

$$\alpha_1\lambda_1^n + \alpha_2\lambda_2^n + \cdots + \alpha_k\lambda_k^n$$

Dividing by  $\lambda^{n-k}$  gives that all these constraints are identical to

$$\underbrace{c_0 \lambda^k + c_1 \lambda^{k-1} + c_2 \cdot \lambda^{k-2} + \dots + c_k}_{\text{characteristic polynomial } P[\lambda]} = 0$$

This means that if  $\lambda_i$  is a root (Nullstelle) of  $P[\lambda]$  then  $T[n] = \lambda_i^n$  is a solution to the recurrence relation.

Let  $\lambda_1, \ldots, \lambda_k$  be the k (complex) roots of  $P[\lambda]$ . Then, because of the vector space property

$$\alpha_1\lambda_1^n + \alpha_2\lambda_2^n + \cdots + \alpha_k\lambda_k^n$$

Dividing by  $\lambda^{n-k}$  gives that all these constraints are identical to

$$\underbrace{c_0 \lambda^k + c_1 \lambda^{k-1} + c_2 \cdot \lambda^{k-2} + \dots + c_k}_{\text{characteristic polynomial } P[\lambda]} = 0$$

This means that if  $\lambda_i$  is a root (Nullstelle) of  $P[\lambda]$  then  $T[n] = \lambda_i^n$  is a solution to the recurrence relation.

Let  $\lambda_1, ..., \lambda_k$  be the k (complex) roots of  $P[\lambda]$ . Then, because of the vector space property

$$\alpha_1\lambda_1^n + \alpha_2\lambda_2^n + \cdots + \alpha_k\lambda_k^n$$

Lemma 5

Assume that the characteristic polynomial has k distinct roots  $\lambda_1, \ldots, \lambda_k$ . Then all solutions to the recurrence relation are of the form

$$\alpha_1\lambda_1^n + \alpha_2\lambda_2^n + \cdots + \alpha_k\lambda_k^n$$
.

Proof.

There is one solution for every possible choice of boundary conditions for  $T[1], \ldots, T[k]$ .

We show that the above set of solutions contains one solution for every choice of boundary conditions.

6.3 The Characteristic Polynomial

Lemma 5

Assume that the characteristic polynomial has k distinct roots  $\lambda_1, \ldots, \lambda_k$ . Then all solutions to the recurrence relation are of the form

$$\alpha_1\lambda_1^n + \alpha_2\lambda_2^n + \cdots + \alpha_k\lambda_k^n$$
.

#### Proof.

There is one solution for every possible choice of boundary conditions for  $T[1], \ldots, T[k]$ .

We show that the above set of solutions contains one solution for every choice of boundary conditions.

### Proof (cont.).

Suppose I am given boundary conditions T[i] and I want to see whether I can choose the  $\alpha'_{is}$  such that these conditions are met:

### Proof (cont.).

Suppose I am given boundary conditions T[i] and I want to see whether I can choose the  $\alpha'_i s$  such that these conditions are met:

 $\alpha_1 \cdot \lambda_1 + \alpha_2 \cdot \lambda_2 + \cdots + \alpha_k \cdot \lambda_k = T[1]$ 

#### Proof (cont.).

Suppose I am given boundary conditions T[i] and I want to see whether I can choose the  $\alpha'_i s$  such that these conditions are met:

$$\alpha_1 \cdot \lambda_1 + \alpha_2 \cdot \lambda_2 + \cdots + \alpha_k \cdot \lambda_k = T[1]$$
  
$$\alpha_1 \cdot \lambda_1^2 + \alpha_2 \cdot \lambda_2^2 + \cdots + \alpha_k \cdot \lambda_k^2 = T[2]$$

Lemma 6

Let  $P[\lambda]$  denote the characteristic polynomial to the recurrence

 $c_0T[n] + c_1T[n-1] + \cdots + c_kT[n-k] = 0$ 

Let  $\lambda_i$ , i = 1, ..., m be the (complex) roots of  $P[\lambda]$  with multiplicities  $\ell_i$ . Then the general solution to the recurrence is given by

$$T[n] = \sum_{i=1}^{m} \sum_{j=0}^{\ell_i-1} \alpha_{ij} \cdot (n^j \lambda_i^n) .$$

The full proof is omitted. We have only shown that any choice of  $\alpha_{ij}$ 's is a solution to the recurrence.

$$T[0] = 0$$
  
 $T[1] = 1$   
 $T[n] = T[n-1] + T[n-2]$  for  $n \ge 2$ 

The characteristic polynomial is

 $\lambda^2 - \lambda - 1$ 

Finding the roots, gives

$$\lambda_{1/2} = \frac{1}{2} \pm \sqrt{\frac{1}{4} + 1} = \frac{1}{2} \left( 1 \pm \sqrt{5} \right)$$

Consider the recurrence relation:

 $c_0 T(n) + c_1 T(n-1) + c_2 T(n-2) + \dots + c_k T(n-k) = f(n)$ with  $f(n) \neq 0$ .

While we have a fairly general technique for solving homogeneous, linear recurrence relations the inhomogeneous case is different.

The general solution of the recurrence relation is

 $T(n) = T_h(n) + T_p(n) ,$ 

where  $T_h$  is any solution to the homogeneous equation, and  $T_p$  is one particular solution to the inhomogeneous equation.

There is no general method to find a particular solution.

6.3 The Characteristic Polynomial

The general solution of the recurrence relation is

 $T(n) = T_h(n) + T_p(n) ,$ 

where  $T_h$  is any solution to the homogeneous equation, and  $T_p$  is one particular solution to the inhomogeneous equation.

There is no general method to find a particular solution.

#### Example:

T[n] = T[n-1] + 1 T[0] = 1

Then,

T[n-1] = T[n-2] + 1  $(n \ge 2)$ 

Subtracting the first from the second equation gives,

 $T[n] - T[n-1] = T[n-1] - T[n-2] \qquad (n \ge 2)$ 

or

 $T[n] = 2T[n-1] - T[n-2] \qquad (n \ge 2)$ 

I get a completely determined recurrence if I add T[0] = 1 and T[1] = 2.

$$T[n] - T[n-1] = T[n-1] - T[n-2] \qquad (n \ge 2)$$

or

 $T[n] = 2T[n-1] - T[n-2] \qquad (n \ge 2)$ 

I get a completely determined recurrence if I add T[0] = 1 and T[1] = 2.

6.3 The Characteristic Polynomial

▲ @ ▶ ▲ 臣 ▶ ▲ 臣 ▶ 89/432

Example:

$$T[n] = T[n-1] + 1$$
  $T[0] = 1$ 

Then,

$$T[n-1] = T[n-2] + 1$$
  $(n \ge 2)$ 

Subtracting the first from the second equation gives,

$$T[n] - T[n-1] = T[n-1] - T[n-2] \qquad (n \ge 2)$$

or

$$T[n] = 2T[n-1] - T[n-2] \qquad (n \ge 2)$$

I get a completely determined recurrence if I add T[0] = 1 and T[1] = 2.

6.3 The Characteristic Polynomial

Example:

$$T[n] = T[n-1] + 1$$
  $T[0] = 1$ 

Then,

$$T[n-1] = T[n-2] + 1$$
  $(n \ge 2)$ 

Subtracting the first from the second equation gives,

$$T[n] - T[n-1] = T[n-1] - T[n-2] \qquad (n \ge 2)$$

or

$$T[n] = 2T[n-1] - T[n-2] \qquad (n \ge 2)$$

I get a completely determined recurrence if I add T[0] = 1 and T[1] = 2.

Example: Characteristic polynomial:

 $\lambda^2 - 2\lambda + 1 = 0$ 

6.3 The Characteristic Polynomial

Example: Characteristic polynomial:

$$\underbrace{\lambda^2 - 2\lambda + 1}_{(\lambda - 1)^2} = 0$$

6.3 The Characteristic Polynomial

◆ 個 ト ◆ 聖 ト ◆ 聖 ト 90/432

Example: Characteristic polynomial:

$$\underbrace{\lambda^2 - 2\lambda + 1}_{(\lambda - 1)^2} = 0$$

Then the solution is of the form

 $T[n] = \alpha 1^n + \beta n 1^n = \alpha + \beta n$ 

6.3 The Characteristic Polynomial

◆ 個 ト ◆ 聖 ト ◆ 聖 ト 90/432

Example: Characteristic polynomial:

$$\underbrace{\lambda^2 - 2\lambda + 1}_{(\lambda - 1)^2} = 0$$

Then the solution is of the form

$$T[n] = \alpha 1^n + \beta n 1^n = \alpha + \beta n$$

T[0] = 1 gives  $\alpha = 1$ .

6.3 The Characteristic Polynomial

◆ 圖 ▶ ◆ 圖 ▶ ◆ 圖 ▶ 90/432

Example: Characteristic polynomial:

$$\underbrace{\lambda^2 - 2\lambda + 1}_{(\lambda - 1)^2} = 0$$

Then the solution is of the form

$$T[n] = \alpha 1^n + \beta n 1^n = \alpha + \beta n$$

T[0] = 1 gives  $\alpha = 1$ .

T[1] = 2 gives  $1 + \beta = 2 \Longrightarrow \beta = 1$ .

**5.** Write f(z) as a formal power series:

$$A(z) = \frac{7}{4} \cdot \frac{1}{1 - 3z} - \frac{1}{4} \cdot \frac{1}{1 - z} - \frac{1}{2} \cdot \frac{1}{(1 - z)^2}$$
  
=  $\frac{7}{4} \cdot \sum_{n \ge 0} 3^n z^n - \frac{1}{4} \cdot \sum_{n \ge 0} z^n - \frac{1}{2} \cdot \sum_{n \ge 0} (n + 1) z^n$   
=  $\sum_{n \ge 0} \left(\frac{7}{4} \cdot 3^n - \frac{1}{4} - \frac{1}{2}(n + 1)\right) z^n$   
=  $\sum_{n \ge 0} \left(\frac{7}{4} \cdot 3^n - \frac{1}{2}n - \frac{3}{4}\right) z^n$

**5.** Write f(z) as a formal power series:

$$\begin{aligned} A(z) &= \frac{7}{4} \cdot \frac{1}{1 - 3z} - \frac{1}{4} \cdot \frac{1}{1 - z} - \frac{1}{2} \cdot \frac{1}{(1 - z)^2} \\ &= \frac{7}{4} \cdot \sum_{n \ge 0} 3^n z^n - \frac{1}{4} \cdot \sum_{n \ge 0} z^n - \frac{1}{2} \cdot \sum_{n \ge 0} (n + 1) z^n \\ &= \sum_{n \ge 0} \left( \frac{7}{4} \cdot 3^n - \frac{1}{4} - \frac{1}{2} (n + 1) \right) z^n \\ &= \sum_{n \ge 0} \left( \frac{7}{4} \cdot 3^n - \frac{1}{2} n - \frac{3}{4} \right) z^n \end{aligned}$$

6. This means  $a_n = \frac{7}{4}3^n - \frac{1}{2}n - \frac{3}{4}$ .

Ernst Mayr, Harald Räcke
