16 Gomory Hu Trees

Given an undirected, weighted graph G = (V, E, c) a cut-tree T = (V, F, w) is a tree with edge-set F and capacities w that fulfills the following properties.

- **1. Equivalent Flow Tree:** For any pair of vertices $s, t \in V$, f(s, t) in G is equal to $f_T(s, t)$.
- **2.** Cut Property: A minimum *s*-*t* cut in *T* is also a minimum cut in *G*.

Here, f(s,t) is the value of a maximum *s*-*t* flow in *G*, and $f_T(s,t)$ is the corresponding value in *T*.

The algorithm maintains a partition of V, (sets $S_1, ..., S_t$), and a spanning tree T on the vertex set $\{S_1, ..., S_t\}$.

Initially, there exists only the set $S_1 = V$.

Then the algorithm performs n-1 split-operations:

- \sim () is then removed from % and replaced by % and %
- and 2 are connected by an edge, and the edges that before the split were incident to 2, are attached to either 22 or 1.

In the end this gives a tree on the vertex set V.

16 Gomory Hu Trees

The algorithm maintains a partition of V, (sets $S_1, ..., S_t$), and a spanning tree T on the vertex set $\{S_1, ..., S_t\}$.

Initially, there exists only the set $S_1 = V$.

Then the algorithm performs n-1 split-operations:

- In each such split-operation it chooses a set 5, with 5, 222, and splits this set into two non-empty parts () and ().
- is then removed from 10 and replaced by 30 and 30.
- S and S are connected by an edge, and the edges that before the split were incident to Scare attached to either S or S.

In the end this gives a tree on the vertex set V.

16 Gomory Hu Trees

The algorithm maintains a partition of V, (sets $S_1, ..., S_t$), and a spanning tree T on the vertex set $\{S_1, ..., S_t\}$.

Initially, there exists only the set $S_1 = V$.

Then the algorithm performs n-1 split-operations:

and splits this set into two non-empty parts (cland) (

In the end this gives a tree on the vertex set V.

16 Gomory Hu Trees

Let S be some minimum r-s cut for some nodes $r, s \in V$ ($s \in S$), and let $v, w \in S$. Then there is a minimum v-w-cut T with $T \subset S$.

Proof: Let S be a minimum operator with S and S and S and S are operator inside S. We may assume w.l.o.g. $s \in X$.

First case $r \in X$.

and a capital standard state capital score

cop(31(5) > cop(5) because 31(5) is an res cut.

This gives cap(5)(32) s cap(5).

Second case $r \notin X$.

cap(3(203) ≥ cap(3) because 3(203) is an 2-3 cut.

This gives cap(3) in 20 in cap(30).

Let S be some minimum r-s cut for some nodes $r, s \in V$ ($s \in S$), and let $v, w \in S$. Then there is a minimum v-w-cut T with $T \subset S$.

Proof: Let *X* be a minimum $v \cdot w$ cut with $X \cap S \neq \emptyset$ and $X \cap (V \setminus S) \neq \emptyset$. Note that $S \setminus X$ and $S \cap X$ are $v \cdot w$ cuts inside *S*. We may assume w.l.o.g. $s \in X$.

First case $r \in X$.

- capital solution of the capital solution of the capital solution.
- cop(%)(%) > cop(%) because %)(% is an res cut.)
- This gives cap(SACO = cap(C).

- cap(XouS) > cap(S) because XouS is an resout.
- This gives cap(\$\overline\$\overli

Let S be some minimum r-s cut for some nodes $r, s \in V$ ($s \in S$), and let $v, w \in S$. Then there is a minimum v-w-cut T with $T \subset S$.

Proof: Let *X* be a minimum $v \cdot w$ cut with $X \cap S \neq \emptyset$ and $X \cap (V \setminus S) \neq \emptyset$. Note that $S \setminus X$ and $S \cap X$ are $v \cdot w$ cuts inside *S*. We may assume w.l.o.g. $s \in X$.

First case $r \in X$.

- a cap (2013) e cap (2013) e cap (2014) e cap (2014)
- cop(31(3)) ≥ cop(3) because 31(3) is an resource.
- This gives cap(SACO = cap(C).

- erap(XouS) > cap(S) because XouS is an resout.
- This gives cap (3 m 20 m cap (3).

Let S be some minimum r-s cut for some nodes $r, s \in V$ ($s \in S$), and let $v, w \in S$. Then there is a minimum v-w-cut T with $T \subset S$.

Proof: Let *X* be a minimum $v \cdot w$ cut with $X \cap S \neq \emptyset$ and $X \cap (V \setminus S) \neq \emptyset$. Note that $S \setminus X$ and $S \cap X$ are $v \cdot w$ cuts inside *S*. We may assume w.l.o.g. $s \in X$.

First case $r \in X$.

cap(30.5) > cap(3) because 30.5 is an residut.

This gives cap(S \ X) is cap(X).

Second case $r \notin X$.

cop(300.5) >= cop(3) because 300.6 is an resout.

This gives cap(3 ~ 20 ~ cap(3)).

Let *S* be some minimum *r*-*s* cut for some nodes $r, s \in V$ ($s \in S$), and let $v, w \in S$. Then there is a minimum v-w-cut *T* with $T \subset S$.

Proof: Let *X* be a minimum $v \cdot w$ cut with $X \cap S \neq \emptyset$ and $X \cap (V \setminus S) \neq \emptyset$. Note that $S \setminus X$ and $S \cap X$ are $v \cdot w$ cuts inside *S*. We may assume w.l.o.g. $s \in X$.

First case $r \in X$.

- $\operatorname{cap}(X \setminus S) + \operatorname{cap}(S \setminus X) \le \operatorname{cap}(S) + \operatorname{cap}(X)$.
- $cap(X \setminus S) \ge cap(S)$ because $X \setminus S$ is an r-s cut.
- This gives $cap(S \setminus X) \le cap(X)$.

- cap(3(203) > cap(3) because 3(203) is an over cut.
- This gives cap (2002) excap (20).

Lemma 3 tells us that if we have a graph G = (V, E) and we contract a subset $X \subset V$ that corresponds to some mincut, then the value of f(s, t) does not change for two nodes $s, t \notin X$.

We will show (later) that the connected components that we contract during a split-operation each correspond to some mincut and, hence, $f_H(s,t) = f(s,t)$, where $f_H(s,t)$ is the value of a minimum *s*-*t* mincut in graph *H*.

Invariant [existence of representatives]:

For any edge $\{S_i, S_j\}$ in T, there are vertices $a \in S_i$ and $b \in S_j$ such that $w(S_i, S_j) = f(a, b)$ and the cut defined by edge $\{S_i, S_j\}$ is a minimum a-b cut in G.

We first show that the invariant implies that at the end of the algorithm T is indeed a cut-tree.

We first show that the invariant implies that at the end of the algorithm T is indeed a cut-tree.

Let s = x₀, x₁, ..., x_{k-1}, x_k = t be the unique simple path from s to t in the final tree T. From the invariant we get that f(x_i, x_{i+1}) = w(x_i, x_{i+1}) for all j.

We first show that the invariant implies that at the end of the algorithm T is indeed a cut-tree.

- Let $s = x_0, x_1, \dots, x_{k-1}, x_k = t$ be the unique simple path from s to t in the final tree T. From the invariant we get that $f(x_i, x_{i+1}) = w(x_i, x_{i+1})$ for all j.
- Then

 $f_T(s,t)$

We first show that the invariant implies that at the end of the algorithm T is indeed a cut-tree.

- ▶ Let $s = x_0, x_1, ..., x_{k-1}, x_k = t$ be the unique simple path from s to t in the final tree T. From the invariant we get that $f(x_i, x_{i+1}) = w(x_i, x_{i+1})$ for all j.
- Then

 $f_T(s,t) = \min_{i \in \{0,\dots,k-1\}} \{w(x_i, x_{i+1})\}$

We first show that the invariant implies that at the end of the algorithm T is indeed a cut-tree.

- Let $s = x_0, x_1, \dots, x_{k-1}, x_k = t$ be the unique simple path from s to t in the final tree T. From the invariant we get that $f(x_i, x_{i+1}) = w(x_i, x_{i+1})$ for all j.
- Then

$$f_T(s,t) = \min_{i \in \{0,\dots,k-1\}} \{w(x_i, x_{i+1})\}$$
$$= \min_{i \in \{0,\dots,k-1\}} \{f(x_i, x_{i+1})\}$$

We first show that the invariant implies that at the end of the algorithm T is indeed a cut-tree.

- ▶ Let $s = x_0, x_1, ..., x_{k-1}, x_k = t$ be the unique simple path from s to t in the final tree T. From the invariant we get that $f(x_i, x_{i+1}) = w(x_i, x_{i+1})$ for all j.
- Then

$$f_T(s,t) = \min_{i \in \{0,\dots,k-1\}} \{w(x_i, x_{i+1})\}$$

=
$$\min_{i \in \{0,\dots,k-1\}} \{f(x_i, x_{i+1})\} \le f(s,t) .$$

We first show that the invariant implies that at the end of the algorithm T is indeed a cut-tree.

=
$$\min_{i \in \{0,\dots,k-1\}} \{f(x_i, x_{i+1})\} \le f(s,t) .$$

- ► Let {x_j, x_{j+1}} be the edge with minimum weight on the path.
- Since by the invariant this edge induces an s-t cut with capacity f(x_j, x_{j+1}) we get f(s,t) ≤ f(x_j, x_{j+1}) = f_T(s,t).

- Hence, $f_T(s,t) = f(s,t)$ (flow equivalence).
- The edge $\{x_j, x_{j+1}\}$ is a mincut between s and t in T.
- By invariant, it forms a cut with capacity f(x_j, x_{j+1}) in G (which separates s and t).
- Since, we can send a flow of value f(x_j, x_{j+1}) btw. s and t, this is an s-t mincut (cut property).

- Hence, $f_T(s,t) = f(s,t)$ (flow equivalence).
- The edge $\{x_j, x_{j+1}\}$ is a mincut between *s* and *t* in *T*.
- By invariant, it forms a cut with capacity f(x_j, x_{j+1}) in G (which separates s and t).

Proof of Invariant

The invariant obviously holds at the beginning of the algorithm.

Now, we show that it holds after a split-operation provided that it was true before the operation.

Let S_i denote our selected cluster with nodes a and b. Because of the invariant all edges leaving $\{S_i\}$ in T correspond to some mincuts.

Therefore, contracting the connected components does not change the mincut btw. *a* and *b* due to Lemma 3.

After the split we have to choose representatives for all edges. For the new edge $\{S_i^a, S_i^b\}$ with capacity $w(S_i^a, S_i^b) = f_H(a, b)$ we can simply choose a and b as representatives.

The invariant obviously holds at the beginning of the algorithm.

Now, we show that it holds after a split-operation provided that it was true before the operation.

Let S_i denote our selected cluster with nodes a and b. Because of the invariant all edges leaving $\{S_i\}$ in T correspond to some mincuts.

Therefore, contracting the connected components does not change the mincut btw. a and b due to Lemma 3.

After the split we have to choose representatives for all edges. For the new edge $\{S_i^a, S_i^b\}$ with capacity $w(S_i^a, S_i^b) = f_H(a, b)$ we can simply choose a and b as representatives.

For edges that are not incident to S_i we do not need to change representatives as the neighbouring sets do not change.

Consider an edge $\{X, S_i\}$, and suppose that before the split it used representatives $x \in X$, and $s \in S_i$. Assume that this edge is replaced by $\{X, S_i^a\}$ in the new tree (the case when it is replaced by $\{X, S_i^b\}$ is analogous).

If $s \in S_i^a$ we can keep x and s as representatives.

Otherwise, we choose x and a as representatives. We need to show that f(x, a) = f(x, s).

For edges that are not incident to S_i we do not need to change representatives as the neighbouring sets do not change.

Consider an edge $\{X, S_i\}$, and suppose that before the split it used representatives $x \in X$, and $s \in S_i$. Assume that this edge is replaced by $\{X, S_i^a\}$ in the new tree (the case when it is replaced by $\{X, S_i^b\}$ is analogous).

If $s \in S_i^a$ we can keep x and s as representatives.

If $s \in S_i^a$ we can keep x and s as representatives.

Otherwise, we choose x and a as representatives. We need to show that f(x, a) = f(x, s).

Because the invariant was true before the split we know that the edge $\{X, S_i\}$ induces a cut in G of capacity f(x, s). Since, x and a are on opposite sides of this cut, we know that $f(x, a) \leq f(x, s)$.

The set *B* forms a mincut separating *a* from *b*. Contracting all nodes in this set gives a new graph *G'* where the set *B* is represented by node v_B . Because of Lemma 3 we know that f'(x, a) = f(x, a) as $x, a \notin B$.

We further have $f'(x, a) \ge \min\{f'(x, v_B), f'(v_B, a)\}$.

Since $s \in B$ we have $f'(v_B, x) \ge f(s, x)$.

Also, $f'(a, v_B) \ge f(a, b) \ge f(x, s)$ since the *a*-*b* cut that splits S_i into S_i^a and S_i^b also separates *s* and *x*.

Because the invariant was true before the split we know that the edge $\{X, S_i\}$ induces a cut in *G* of capacity f(x, s). Since, *x* and *a* are on opposite sides of this cut, we know that $f(x, a) \leq f(x, s)$.
