Collection of trees that fulfill the heap property.

Structure is much more relaxed than binomial heaps.

◆ □ ▶ < □ ▶
 342/432

Additional implementation details:

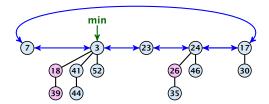

- Every node x stores its degree in a field x. degree. Note that this can be updated in constant time when adding a child to x.
- Every node stores a boolean value x.marked that specifies whether x is marked or not.

8.3 Fibonacci Heaps

The potential function:

- t(S) denotes the number of trees in the heap.
- m(S) denotes the number of marked nodes.
- We use the potential function $\Phi(S) = t(S) + 2m(S)$.

The potential is $\Phi(S) = 5 + 2 \cdot 3 = 11$.

8.3 Fibonacci Heaps

▲ 圖 ▶ ▲ 置 ▶ ▲ 置 ▶ 344/432 We assume that one unit of potential can pay for a constant amount of work, where the constant is chosen "big enough" (to take care of the constants that occur).

To make this more explicit we use *c* to denote the amount of work that a unit of potential can pay for.

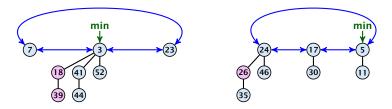

S. minimum()

- Access through the min-pointer.
- ► Actual cost O(1).
- No change in potential.
- Amortized cost $\mathcal{O}(1)$.

- S.merge(S')
 - Merge the root lists.
 - Adjust the min-pointer

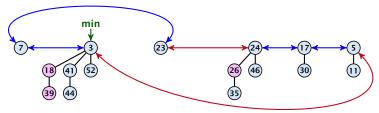

8.3 Fibonacci Heaps

▲ 個 ▶ ▲ E ▶ ▲ E ▶ 347/432

- S.merge(S')
 - Merge the root lists.
 - Adjust the min-pointer

Running time:

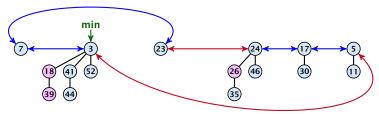

► Actual cost O(1).

Lemma 1

Let x be a node with degree k and let $y_1, ..., y_k$ denote the children of x in the order that they were linked to x. Then

degree
$$(\gamma_i) \ge \begin{cases} 0 & \text{if } i = 1\\ i - 2 & \text{if } i > 1 \end{cases}$$

Proof

- ► When y_i was linked to x, at least y₁,..., y_{i-1} were already linked to x.
- Hence, at this time degree(x) ≥ i − 1, and therefore also degree(y_i) ≥ i − 1 as the algorithm links nodes of equal degree only.
- Since, then y_i has lost at most one child.
- Therefore, degree(y_i) $\ge i 2$.

Proof

- ▶ When y_i was linked to x, at least y₁,..., y_{i-1} were already linked to x.
- Hence, at this time degree(x) ≥ i − 1, and therefore also degree(y_i) ≥ i − 1 as the algorithm links nodes of equal degree only.
- Since, then y_i has lost at most one child.
- Therefore, degree(y_i) $\ge i 2$.

Proof

Definition 2

Consider the following non-standard Fibonacci type sequence:

$$F_k = \begin{cases} 1 & \text{if } k = 0\\ 2 & \text{if } k = 1\\ F_{k-1} + F_{k-2} & \text{if } k \ge 2 \end{cases}$$

Facts:

1. $F_k \ge \phi^k$. 2. For $k \ge 2$: $F_k = 2 + \sum_{i=0}^{k-2} F_i$.

The above facts can be easily proved by induction. From this it follows that $s_k \ge F_k \ge \phi^k$, which gives that the maximum degree in a Fibonacci heap is logarithmic.

k=0:

$$l = F_0 \ge \Phi^0 = 1$$

k=1:
 $2 = F_1 \ge \Phi^1 \approx 1.61$
 $F_k = F_{k-1} + F_{k-2} \ge \Phi^{k-1} + \Phi^{k-2} = \Phi^{k-2}(\Phi + 1) = \Phi^k$

k=2:
$$3 = F_2 = 2 + 1 = 2 + F_0$$

k-1 \rightarrow k: $F_k = F_{k-1} + F_{k-2} = 2 + \sum_{i=0}^{k-3} F_i + F_{k-2} = 2 + \sum_{i=0}^{k-2} F_i$
