- Then the input length is $L=\Theta(\langle A\rangle+\langle b\rangle)$.
- In the following we sometimes refer to $L:=\langle A\rangle+\langle b\rangle$ as the input size (even though the real input size is something in $\Theta(\langle A\rangle+\langle b\rangle))$.

$$
\operatorname{vol}(L(K))=|\operatorname{det}(L)| \cdot \operatorname{vol}(K) .

For computing the matrix $Q^{\prime}$ of the new ellipsoid we assume in the following that $\hat{E}^{\prime}, \bar{E}^{\prime}$ and $E^{\prime}$ refer to the ellispoids centered in the origin.

Recall that

$$
\hat{Q}^{\prime}=\left(\begin{array}{cccc}
a^{2} & 0 & \ldots & 0 \\
0 & b^{2} & \ddots & \vdots \\
\vdots & \ddots & \ddots & 0 \\
0 & \ldots & 0 & b^{2}
\end{array}\right)
$$

Recall that

$$
\hat{Q}^{\prime}=\left(\begin{array}{cccc}
a^{2} & 0 & \ldots & 0 \\
0 & b^{2} & \ddots & \vdots \\
\vdots & \ddots & \ddots & 0 \\
0 & \ldots & 0 & b^{2}
\end{array}\right)
$$

This gives

$$
\hat{Q}^{\prime}=\frac{n^{2}}{n^{2}-1}\left(I-\frac{2}{n+1} e_{1} e_{1}^{T}\right)
$$

Recall that

$$
\hat{Q}^{\prime}=\left(\begin{array}{cccc}
a^{2} & 0 & \ldots & 0 \\
0 & b^{2} & \ddots & \vdots \\
\vdots & \ddots & \ddots & 0 \\
0 & \ldots & 0 & b^{2}
\end{array}\right)
$$

This gives

$$
\hat{Q}^{\prime}=\frac{n^{2}}{n^{2}-1}\left(I-\frac{2}{n+1} e_{1} e_{1}^{T}\right)
$$

because for $a^{2}=n^{2} /(n+1)^{2}$ and $b^{2}=n^{2} / n^{2}-1$

Recall that

$$
\hat{Q}^{\prime}=\left(\begin{array}{cccc}
a^{2} & 0 & \ldots & 0 \\
0 & b^{2} & \ddots & \vdots \\
\vdots & \ddots & \ddots & 0 \\
0 & \ldots & 0 & b^{2}
\end{array}\right)
$$

This gives

$$
\hat{Q}^{\prime}=\frac{n^{2}}{n^{2}-1}\left(I-\frac{2}{n+1} e_{1} e_{1}^{T}\right)
$$

because for $a^{2}=n^{2} /(n+1)^{2}$ and $b^{2}=n^{2} / n^{2}-1$

$$
b^{2}-b^{2} \frac{2}{n+1}
$$

Recall that

$$

0 & b^{2} & \ddots & \vdots \\
\vdots & \ddots & \ddots & 0 \\

\end{array}\right)
$$

This gives

$$
\hat{Q}^{\prime}=\frac{n^{2}}{n^{2}-1}\left(I-\frac{2}{n+1} e_{1} e_{1}^{T}\right)

because for $a^{2}=n^{2} /(n+1)^{2}$ and $b^{2}=n^{2} / n^{2}-1$

$$
b^{2}-b^{2} \frac{2}{n+1}=\frac{n^{2}}{n^{2}-1}-\frac{2 n^{2}}{(n-1)(n+1)^{2}}
$$

Recall that

0 & b^{2} & \ddots & \vdots \\

$$

This gives

$$

$$

because for $a^{2}=n^{2} /(n+1)^{2}$ and $b^{2}=n^{2} / n^{2}-1$

$$

b^{2}-b^{2} \frac{2}{n+1} & =\frac{n^{2}}{n^{2}-1}-\frac{2 n^{2}}{(n-1)(n+1)^{2}} \\
& =\frac{n^{2}(n+1)-2 n^{2}}{(n-1)(n+1)^{2}}=\frac{n^{2}(n-1)}{(n-1)(n+1)^{2}}
\end{aligned}
$$

Recall that

$$
\hat{Q}^{\prime}=\left(\begin{array}{cccc}

Let $P=\left\{x \in \mathbb{R}^{n} \mid A x \leq b\right\}$ be a bounded polyhedron. Let

In the following we use $\delta:=2^{L}$.

## Proof:

We can replace $P$ by $P^{\prime}:=\left\{x \mid A^{\prime} x \leq b ; x \geq 0\right\}$ where $A^{\prime}=[A-A]$. The lemma follows by applying Lemma 2 , and observing that $\left\langle A^{\prime}\right\rangle=2\langle A\rangle$ and $n^{\prime}=2 n$.
