### Abuse of notation

1. People write  $f = \mathcal{O}(g)$ , when they mean  $f \in \mathcal{O}(g)$ . This is **not** an equality (how could a function be equal to a set of functions).

2. In this context f(n) does not mean the function f evaluated at n, but instead it is a shorthand for the function itself (leaving out domain and codomain and only giving the rule)

of correspondence of the function).

**3.** This is particularly useful if you do not want to ignore constant factors. For example the median of n elements can be determined using  $\frac{3}{2}n + o(n)$  comparisons.

of correspondence of the function).

#### Abuse of notation

- 1. People write  $f = \mathcal{O}(g)$ , when they mean  $f \in \mathcal{O}(g)$ . This is **not** an equality (how could a function be equal to a set of functions).
- **2.** People write  $f(n) = \mathcal{O}(g(n))$ , when they mean  $f \in \mathcal{O}(g)$ , with  $f: \mathbb{N} \to \mathbb{R}^+, n \mapsto f(n)$ , and  $g: \mathbb{N} \to \mathbb{R}^+, n \mapsto g(n)$ .

2. In this context f(n) does **not** mean the function f evaluated at n, but instead it is a shorthand for the function itself (leaving out domain and codomain and only giving the rule using  $\frac{3}{2}n + o(n)$  comparisons.

- **4.** People write  $\mathcal{O}(f(n)) = \mathcal{O}(g(n))$ , when they mean  $\mathcal{O}(f(n)) \subseteq \mathcal{O}(g(n))$ . Again this is not an equality.
- 2. In this context f(n) does **not** mean the function f evaluated at n, but instead it is a shorthand for the function itself (leaving out domain and codomain and only giving the rule of correspondence of the function).

How do we interpret an expression like:

$$2n^2 + 3n + 1 = 2n^2 + \Theta(n)$$

How do we interpret an expression like:

$$2n^2 + 3n + 1 = 2n^2 + \Theta(n)$$

Here,  $\Theta(n)$  stands for an anonymous function in the set  $\Theta(n)$  that makes the expression true.

How do we interpret an expression like:

$$2n^2 + 3n + 1 = 2n^2 + \Theta(n)$$

Here,  $\Theta(n)$  stands for an anonymous function in the set  $\Theta(n)$  that makes the expression true.

Note that  $\Theta(n)$  is on the right hand side, otw. this interpretation is wrong.

How do we interpret an expression like:

$$2n^2 + \mathcal{O}(n) = \Theta(n^2)$$

How do we interpret an expression like:

$$2n^2 + \mathcal{O}(n) = \Theta(n^2)$$

Regardless of how we choose the anonymous function  $f(n) \in \mathcal{O}(n)$  there is an anonymous function  $g(n) \in \Theta(n^2)$  that makes the expression true.

How do we interpret an expression like:

$$\sum_{i=1}^{n} \Theta(i) = \Theta(n^2)$$

How do we interpret an expression like:

$$\sum_{i=1}^{n} \Theta(i) = \Theta(n^2)$$

Careful!

The  $\Theta(i)$ -symbol on the left represents one anonymous function  $f: \mathbb{N} \to \mathbb{R}^+$ , and then  $\sum_i f(i)$  is computed.

How do we interpret an expression like:

$$\sum_{i=1}^{n} \Theta(i) = \Theta(n^2)$$

### Careful!

"It is understood" that every occurrence of an  $\mathcal{O}$ -symbol (or  $\Theta, \Omega, \rho, \omega$ ) on the left represents one anonymous function.

Hence, the left side is **not** equal to

$$\Theta(1) + \Theta(2) + \cdots + \Theta(n-1) + \Theta(n)$$

 $\Theta(1) + \Theta(2) + \cdots + \Theta(n-1) + \Theta(n)$  does not really have a reasonable interpreta-

We can view an expression containing asymptotic notation as generating a set:

$$n^2 \cdot \mathcal{O}(n) + \mathcal{O}(\log n)$$

### represents

$$\begin{cases} f: \mathbb{N} \to \mathbb{R}^+ \mid f(n) = n^2 \cdot g(n) + h(n) \\ & \text{with } g(n) \in \mathcal{O}(n) \text{ and } h(n) \in \mathcal{O}(\log n) \end{cases}$$
 Recall that according to the previous slide e.g. the expressions  $\sum_{i=1}^n \mathcal{O}(i)$  and  $\sum_{i=1}^{n-1} \mathcal{O}(i) + \sum_{i=n/2+1}^n \mathcal{O}(i)$  generate differential of the previous of the

Then an asymptotic equation can be interpreted as containement btw. two sets:

$$n^2 \cdot \mathcal{O}(n) + \mathcal{O}(\log n) = \Theta(n^2)$$

represents

$$n^2 \cdot \mathcal{O}(n) + \mathcal{O}(\log n) \subseteq \Theta(n^2)$$

Note that the equation does not hold.

### Lemma 1

Let f,g be functions with the property

$$\exists n_0 > 0 \ \forall n \ge n_0 : f(n) > 0$$
 (the same for g). Then

 $ightharpoonup c c \cdot f(n) \in \Theta(f(n))$  for any constant c

#### Lemma 1

Let f, g be functions with the property

 $\exists n_0 > 0 \ \forall n \ge n_0 : f(n) > 0$  (the same for g). Then

- $c \cdot f(n) \in \Theta(f(n))$  for any constant c

#### Lemma 1

Let f, g be functions with the property

 $\exists n_0 > 0 \ \forall n \ge n_0 : f(n) > 0$  (the same for g). Then

- $c \cdot f(n) \in \Theta(f(n))$  for any constant c
- $\bullet \ \mathcal{O}(f(n)) \cdot \mathcal{O}(g(n)) = \mathcal{O}(f(n) \cdot g(n))$

#### Lemma 1

Let f, g be functions with the property

 $\exists n_0 > 0 \ \forall n \ge n_0 : f(n) > 0$  (the same for g). Then

- $ightharpoonup c \cdot f(n) \in \Theta(f(n))$  for any constant c
- O(f(n)) + O(g(n)) = O(f(n) + g(n))
- $\bullet \ \mathcal{O}(f(n)) \cdot \mathcal{O}(g(n)) = \mathcal{O}(f(n) \cdot g(n))$
- $\bullet \ \mathcal{O}(f(n)) + \mathcal{O}(g(n)) = \mathcal{O}(\max\{f(n), g(n)\})$

#### Lemma 1

Let f, g be functions with the property

 $\exists n_0 > 0 \ \forall n \ge n_0 : f(n) > 0$  (the same for g). Then

- $c \cdot f(n) \in \Theta(f(n))$  for any constant c
- $\bullet \ \mathcal{O}(f(n)) \cdot \mathcal{O}(g(n)) = \mathcal{O}(f(n) \cdot g(n))$
- $\bullet \ \mathcal{O}(f(n)) + \mathcal{O}(g(n)) = \mathcal{O}(\max\{f(n), g(n)\})$

The expressions also hold for  $\Omega$ . Note that this means that  $f(n) + g(n) \in \Theta(\max\{f(n), g(n)\})$ .

#### Comments

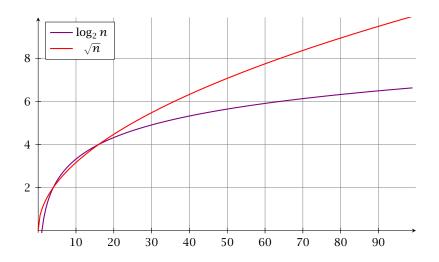

Do not use asymptotic notation within induction proofs.

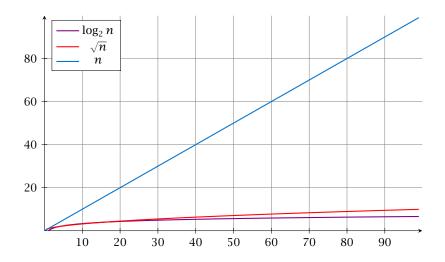

#### **Comments**

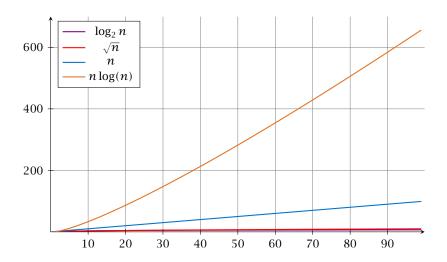

- Do not use asymptotic notation within induction proofs.
- For any constants a, b we have  $\log_a n = \Theta(\log_b n)$ . Therefore, we will usually ignore the base of a logarithm within asymptotic notation.

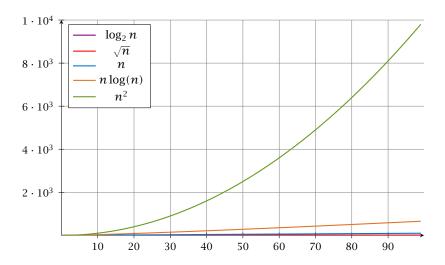

#### Comments

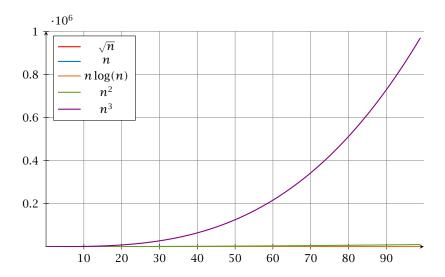

- Do not use asymptotic notation within induction proofs.
- For any constants a, b we have  $\log_a n = \Theta(\log_b n)$ . Therefore, we will usually ignore the base of a logarithm within asymptotic notation.
- In general  $\log n = \log_2 n$ , i.e., we use 2 as the default base for the logarithm.
